

WHAT IS CLAIMED IS:

1. A method, comprising:
detecting a signal received over a Rayleigh fading channel, and
estimating a Doppler spread associated with the Rayleigh fading channel based on
an autocorrelation function of a sequence of complex channel estimates.
2. The method in claim 1, wherein the received signal includes a known signal,
the method further comprising:
obtaining the complex channel estimates from the known sequence in a first
sampling interval and the known sequence in a second sampling interval.
3. The method in claim 2, further comprising:
complex-conjugating a sequence of complex channel estimates obtained from the
known sequence in a first sampling interval, and
correlating the complex-conjugated sequence with a sequence of complex channel
estimates obtained from a second sampling interval.
4. The method in claim 2, further comprising:
compensating the known sequence for a frequency offset.
5. The method in claim 4, wherein the frequency offset is determined using a
correlation of the known sequence in the received signal.
6. The method in claim 4, further comprising:
using the estimated Doppler spread and the compensated known sequence to
estimate the Rayleigh channel,
filtering an unknown sequence in the received signal using the channel estimate to
compensate for phase changes caused by Rayleigh fading.
7. The method in claim 1, further comprising:
detecting a zero crossing of the complex correlation, and
calculating the Doppler spread using the zero crossing and a Bessel function.

8. The method in claim 7, wherein the zero crossing is detected using interpolation.

9. The method in claim 1, further comprising:
using the estimated Doppler spread to estimate the Rayleigh channel,
wherein the channel estimate filters the received signal to compensate for a phase
changes caused by Rayleigh fading.

10. A method, comprising:
sampling a signal with a known sequence p_n received over a Rayleigh fading
channel, and
calculating a Doppler spread associated with the Rayleigh fading channel by
autocorrelating a sequence of complex channel estimates obtained from the known
sequence in a first sampling interval and the known sequence in a second sampling
interval.

11. The method in claim 10, further comprising:
calculating the autocorrelation using the following:

$$\hat{C}_l = \sum_{k=0}^N (p_k) * (p_{k+l})$$

where \hat{C}_l is an autocorrelation function, l is a lag in the autocorrelation function, and N is a number of channel coefficients used for estimating the Rayleigh fading channel.

12. The method in claim 11, further comprising:
determining a zero crossing for the autocorrelation function \hat{C}_l .

13. The method in claim 12, wherein the zero crossing is a first zero crossing
determined for the autocorrelation function \hat{C}_l and is determined by interpolation.

14. The method in claim 12, further comprising:
using the zero crossing, calculating the Doppler spread \hat{f}_d using the following:

$$\hat{f}_d = \frac{J_z}{2\pi \cdot i_z \cdot T_s}$$

where T_s is the sample time, i_z is the zero crossing for the autocorrelation function \hat{C}_l , and J_z is a lowest positive value that satisfies the following:

$$J_0(J_z) = 0$$

5 where J_0 is the zero-order Bessel function.

15. The method in claim 14, further comprising:
compensating the known sequence for a frequency offset.

16. The method in claim 15, wherein the frequency offset is determined using a correlation of the known sequence in the received signal.

10 17. The method in claim 15, further comprising:
using the estimated Doppler spread and the compensated known sequence to estimate the Rayleigh channel,
wherein the channel estimate filters an unknown sequence in the received signal to compensate for phase changes caused by Rayleigh fading.

18. The method in claim 14, further comprising:
using the estimated Doppler spread to estimate the Rayleigh channel,
filtering an unknown sequence in the received signal using the channel estimate to compensate for phase changes caused by Rayleigh fading.

19. Apparatus for use in a receiver, comprising:
20 a detector configured to detect a signal with a known sequence received over a Rayleigh fading channel associated with a communication with a transmitter, and
a Doppler spread estimator configured to estimate a Doppler spread associated with the Rayleigh fading channel including an autocorrelator configured to calculate an autocorrelation function of a sequence of complex channel estimates determined using
25 the known sequence.

20. The apparatus in claim 19, wherein the complex channel estimates are obtained from the known sequence in a first sampling interval and the known sequence in a second sampling interval.

21. The apparatus in claim 20, further comprising:

5 a frequency offset compensator configured to compensate the known sequence for a frequency offset.

22. The apparatus in claim 21, wherein the frequency offset compensator is configured to determine the frequency offset using a correlation of the known sequence in the received signal.

10 23. The apparatus in claim 22, further comprising:

a channel estimator configured to estimate the Rayleigh channel using the estimated Doppler spread and the compensated known sequence,
wherein the channel estimator is configured to filter an unknown sequence in the received signal to compensate for phase changes caused by Rayleigh fading.

15 24. The apparatus in claim 19, further comprising:

a zero crossing detector configured to detect a zero crossing of the autocorrelation,
and
wherein the Doppler spread estimator is configured to calculate the Doppler spread using the zero crossing and a Bessel function.

20 25. The apparatus in claim 24, wherein the zero crossing detector is configured to use interpolation to detect the zero crossing.

26. The apparatus in claim 19, further comprising:

a channel estimator configured to estimate the Rayleigh channel using the estimated Doppler spread,
25 wherein the channel estimator is configured to filter an unknown sequence in the received signal to compensate for phase changes caused by Rayleigh fading.

27. Apparatus, comprising:

means for sampling a signal with a known sequence p_n received over a Rayleigh fading channel, and

means for calculating a Doppler spread associated with the Rayleigh fading channel

using an autocorrelation function of the Rayleigh fading channel determined using the known sequence samples in the received signal.

28. The apparatus in claim 27, wherein the means for calculating calculates the autocorrelation function using the following:

$$\hat{C}_l = \sum_{k=0}^N (p_k) * (p_{k+l})$$

where \hat{C}_l is the autocorrelation function, l is a lag in the autocorrelation function, and N is a number of channel coefficients used for estimating the Rayleigh fading channel.

29. The apparatus in claim 30, further comprising:

means for determining a zero crossing for the autocorrelation function \hat{C}_l .

30. The in claim 31, wherein the zero crossing is a first zero crossing determined for the autocorrelation function \hat{C}_l and is determined by interpolation.

31. The apparatus in claim 30, wherein the means for calculating uses the zero crossing to calculate the Doppler spread f_d in accordance with the following:

$$\hat{f}_d = \frac{J_z}{2\pi \cdot i_z \cdot T_s}$$

where T_s is the sample time, i_z is the zero crossing of the autocorrelation function \hat{C}_l ,

and J_z is a lowest positive value that satisfies the following:

$$J_0(J_z) = 0$$

where J_0 is the zero-order Bessel function.

32. The apparatus in claim 31, further comprising:

means for compensating the known sequence for a frequency offset.

33. The apparatus in claim 32, wherein the frequency offset is determined using a correlation of the known sequence in the received signal.

34. The apparatus in claim 33, further comprising:

5 means for estimating the Rayleigh channel using the estimated Doppler spread and the compensated known sequence,

wherein the estimated channel is used to compensate an unknown sequence in the received signal for phase changes caused by Rayleigh fading.

35. The apparatus in claim 27, further comprising:

10 means for estimating the Rayleigh channel using the estimated Doppler spread,

wherein the estimated channel is used to compensate an unknown sequence in the received signal for phase changes error caused by Rayleigh fading.
